

- Given an integer k and n elements $x_1, x_2, ..., x_n$, taken from a total order, find the k-th smallest element in this set.
- Of course, we can sort the set in O(n log n) time and then index the k-th element.

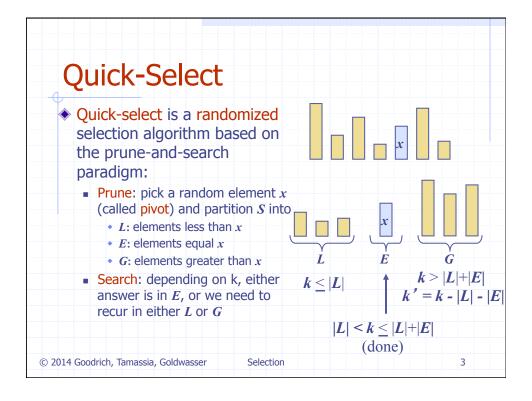

k=3 $7 4 9 <u>6</u> 2 <math>\rightarrow$ 2 4 <u>6</u> 7 9

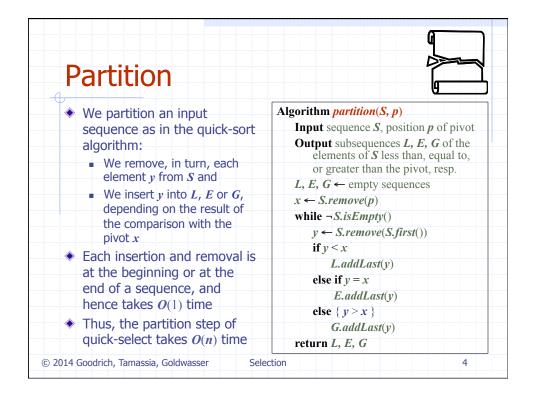

Can we solve the selection problem faster?

Expected Running Time, Part 2

- Probabilistic Fact #1: The expected number of coin tosses required in order to get one head is two
- Probabilistic Fact #2: Expectation is a linear function:
 - E(X+Y) = E(X) + E(Y)
 - E(cX) = cE(X)
- Let T(n) denote the expected running time of quick-select.
- ◆ By Fact #2,
 - $T(n) \le T(3n/4) + bn*$ (expected # of calls before a good call)
- ◆ By Fact #1,
 - $T(n) \le T(3n/4) + 2bn$
- That is, T(n) is a geometric series:
 - $T(n) \le 2bn + 2b(3/4)n + 2b(3/4)^2n + 2b(3/4)^3n + \dots$
- So T(n) is O(n).
- We can solve the selection problem in O(n) expected time.
