

Breadth-First Search Breadth-first search BFS on a graph with n (BFS) is a general vertices and m edges technique for traversing takes O(n + m) time a graph BFS can be further. A BFS traversal of a extended to solve other graph G graph problems Visits all the vertices and Find and report a path edges of G with the minimum Determines whether G is number of edges connected between two given Computes the connected vertices components of G Computes a spanning Find a simple cycle, if forest of G there is one © 2014 Goodrich, Tamassia, Goldwasser **Breadth-First Search**

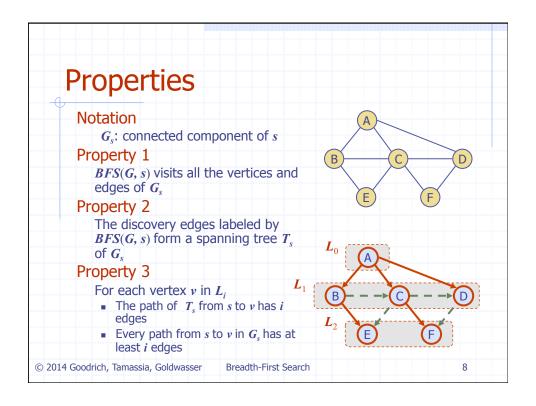

```
Java Implementation
               /** Performs breadth-first search of Graph g starting at Vertex u. */
               public static <V,E> void BFS(Graph<V,E> g, Vertex<V> s,
                                  Set < Vertex < V >> known, Map < Vertex < V >, Edge < E >> forest) \{
                 PositionalList<Vertex<V>> level = new LinkedPositionalList<>();
                known.add(s);
                level.addLast(s);
                                                        // first level includes only s
                while (!level.isEmpty()) {
           8
                   PositionalList<Vertex<V>> nextLevel = new LinkedPositionalList<>();
           9
                   for (Vertex<V> u : level)
          10
                     \textbf{for} \; (\mathsf{Edge}{<}\mathsf{E}{>}\; e : \mathsf{g.outgoingEdges}(\mathsf{u})) \; \{
          11
                       Vertex < V > v = g.opposite(u, e);
          12
                       if (!known.contains(v)) {
          13
                         known.add(v);
          14
                         forest.put(v, e);
                                                        // e is the tree edge that discovered v
          15
                         nextLevel.addLast(v);
                                                        // v will be further considered in next pass
          16
          17
          18
                   level = nextLevel;
                                                        // relabel 'next' level to become the current
          19

                                           Breadth-First Search
```

Analysis

- \Box Setting/getting a vertex/edge label takes O(1) time
- Each vertex is labeled twice
 - once as UNEXPLORED
 - once as VISITED
- Each edge is labeled twice
 - once as UNEXPLORED
 - once as DISCOVERY or CROSS
- Each vertex is inserted once into a sequence L_i
- Method incidentEdges is called once for each vertex
- \Box BFS runs in O(n + m) time provided the graph is represented by the adjacency list structure
 - Recall that $\sum_{v} \deg(v) = 2m$

Applications

- using the template method pattern, we can specialize the BFS traversal of a graph G to solve the following problems in O(n + m) time
 - Compute the connected components of G
 - Compute a spanning forest of G
 - Find a simple cycle in G, or report that G is a forest
 - Given two vertices of G, find a path in G between them with the minimum number of edges, or report that no such path exists
